# AI CREATOR BUSINESS PLATFORM

MVP Product and Technical Implementation Guide

**Purpose**
Product requirements, UX guidelines, architecture, and implementation roadmap for building an AI-powered platform that helps content creators discover, create, and sell digital products.

**Product vision**
Enable creators to turn their expertise, content, and audience into a digital product business with minimal manual effort.

Implementation reference for Claude, Codex, and the development team

# 1. Product Overview

The platform is an AI-powered digital product creation and commerce application for content creators. Creators connect social profiles or provide content samples. The platform analyzes their niche, expertise, audience interests, and content themes, then recommends digital products they could sell.

After selecting a product idea, creators use AI to generate the product, customize it, create a branded landing page, connect payment processing, and publish the product for sale. The platform automates as much as possible while allowing creators to review, edit, and approve important outputs.

**Core value proposition: Turn your content and expertise into digital products you can sell to your audience - without building everything yourself.**

## Target users

- Social media creators and influencers
- Educators and online instructors
- Coaches and consultants
- Niche experts
- Creators with small or growing audiences who lack monetization opportunities
- Established creators looking to diversify income

**Primary user outcome:** A creator should be able to go from connecting their profile to publishing a sellable digital product in approximately 30 minutes, depending on product complexity.

# 2. MVP Scope

## Included in the MVP

- Creator onboarding and profile setup
- Social profile connection or content upload
- AI-powered niche and audience analysis
- Digital product idea discovery and product opportunity research
- AI product generation, editing, and customization
- Product cover and visual design generation
- PDF and downloadable file generation
- AI-generated product landing pages and creator storefront
- Payment integration and automated digital delivery
- Transactional emails and receipts
- Basic sales and product analytics
- Responsive desktop and mobile browser UI

## Explicitly excluded from the MVP

- Physical product creation, print-on-demand, supplier discovery, inventory, shipping, fulfillment, and custom manufacturing

- Native iOS and Android applications
- Advanced email marketing automation, autonomous social posting, complex multi-agent collaboration, and advanced affiliate management
- Custom domain automation unless straightforward to support

These capabilities may be introduced after the digital product workflow is validated.

# 3. Product Architecture and User Journey

1. Creator creates an account and completes onboarding.
2. Creator connects a social profile or provides content samples.
3. AI analyzes niche, expertise, content, and audience.
4. AI recommends digital product opportunities.
5. Creator selects a product idea.
6. AI generates a product outline; creator reviews and approves it.
7. AI generates the product content and formats downloadable files.
8. Creator edits and approves the final product.
9. AI generates a branded landing page.
10. Creator configures pricing and payment processing.
11. Creator publishes the product.
12. Customers purchase and receive the product automatically.
13. Creator monitors sales and product performance.

Save progress throughout the workflow so users can leave and return without losing work.

# 4. UX and UI Design Guidelines

## Design philosophy

The UI should be clean, minimalist, process-oriented, and easy to understand. It should feel like a guided AI workspace rather than a complicated collection of tools.

**Design references:** Linear for clarity and spacing; Notion for approachable editing and content organization; Shopify for commerce workflows. Use these as references, not interfaces to copy.

### Visual design system

| Element | Guideline |
|---|---|
| Background | White or warm off-white |
| Primary text | Near-black |
| Secondary text | Muted grey |
| Accent color | One restrained violet, blue, or indigo |
| Typography | Inter or Geist |
| Cards | White backgrounds with subtle borders |
| Corners | 12-16px radius |
| Buttons | Clear hierarchy and consistent sizing |
| Icons | Consistent outline icon set |
| Animation | Subtle transitions and progress indicators |

Avoid excessive gradients, decorative animations, unnecessary charts, and crowded dashboards.

### Desktop layout

Use a compact left sidebar and spacious main workspace. Navigation: Overview; Discover Product Ideas; My Products; My Storefront; Sales & Analytics; Settings. The main workspace should display the current task, progress, and next recommended action.

### Mobile browser layout

- Use compact or bottom navigation and large touch targets.
- Display one primary action per screen.
- Avoid dense tables and keep product previews readable.
- Make product approval and publishing easy.
- Use sticky bottom action buttons in multi-step workflows.
- Build responsively from the beginning; do not create separate desktop and mobile applications for the MVP.

### Guided creation workflow

Use a persistent five-step progress indicator: Profile → Ideas → Create → Customize → Publish. Each step explains what the creator is doing, what AI has completed, what requires input, and what happens next.

# 5. Application Screens

## 5.1 Authentication

- Email and password authentication
- Google authentication if supported by the auth provider
- Password reset and email verification

- Secure session management

### 5.2 Onboarding

Collect creator name, brand or creator name, industry or niche, primary social platform, profile URL, target audience, and optional business goals. Allow optional fields to be skipped.

### 5.3 Creator profile analysis

Display creator niche, main content themes, expertise areas, audience interests, common audience problems, and potential monetization opportunities. Allow creators to edit incorrect information.

### 5.4 Product idea discovery

Display recommendations as cards containing product title, format, target audience, problem solved, value proposition, supporting demand signals, suggested price range, creation complexity, and confidence/evidence limitations. Add filters for format, price, and complexity.

### 5.5 Product editor

- Editable titles, headings, paragraphs, and chapter navigation
- AI-assisted rewriting and section regeneration
- Content expansion or summarization
- Image replacement and cover customization
- Autosave and version history
- PDF preview and export

Do not build a full Canva-like design editor for the MVP.

### 5.6 Landing page builder

Generate a responsive product page with product title, cover or preview, description, benefits, what's included, creator introduction, FAQs, pricing, purchase CTA, refund policy link, terms, and privacy links. Allow copy, image, theme, and pricing edits.

### 5.7 Creator dashboard

Display product creation progress, draft and published products, storefront status, sales summary, recent orders, and recommended next actions. Keep the dashboard actionable.

## 6. AI Agent and Skill Architecture

Implement a central orchestrator coordinating specialized agents and reusable skills. Use controlled workflows rather than unrestricted autonomous agents.

### Agents

| Agent | Responsibilities |
|---|---|
| Audience Intelligence | Analyze profile information; identify niche, expertise, recurring themes, audience problems, and interests; produce a structured creator profile. |
| Product Strategy | Generate product ideas; evaluate audience fit; identify demand signals; recommend formats; suggest pricing hypotheses; explain validation rationale. |
| Product Creation | Create outlines, chapters, examples, and exercises; maintain consistency; revise based on creator feedback. |
| Design | Generate cover concepts; apply branding; select typography and colors; generate illustrations; prepare product assets. |
| Landing Page | Generate product descriptions, sales copy, page sections, FAQs, CTAs, and page structure. |

### Orchestrator responsibilities

- Maintain workflow state and dispatch tasks to agents
- Validate inputs and outputs; track task completion
- Handle retries and failures; request creator approval at checkpoints
- Resume interrupted workflows
- Prevent duplicate execution of side-effecting operations

### Reusable skill library

| Category | Skills |
|---|---|
| Research | Analyze creator content; extract audience questions; research topic; identify demand signals; analyze competing products; summarize evidence. |
| Writing | Generate outline; write chapter; generate examples/exercises; rewrite for audience; check tone and consistency; identify unsupported claims. |
| Design | Generate cover concept/artwork; apply brand colors and typography; format document; generate preview images. |
| Commerce | Generate listing; generate landing page copy; validate metadata; publish approved product; generate receipt content. |

Skills must have defined input and output schemas, instructions, and validation rules. Commerce skills must call deterministic backend services for payments, publishing, and delivery.

# 7. AI Workflow Design

### Product idea generation

1. Extract creator expertise and recurring themes.
2. Identify audience problems.
3. Generate candidate digital product ideas.
4. Research available demand signals.

5 Evaluate relevance and feasibility.

6 Rank recommendations.

7 Return structured product idea cards.

**Output fields:** product name, format, audience, problem solved, value proposition, suggested price, evidence, confidence, and limitations.

Do not present AI-generated demand estimates as verified market data.

## Product creation

1 Creator selects an idea.

2 Product Creation Agent generates an outline.

3 Creator approves or edits the outline.

4 Agent generates each section.

5 Quality review checks consistency, completeness, and factual claims.

6 Creator reviews the draft.

7 Design Agent formats the product.

8 System generates PDF and supporting files.

9 Creator approves the final product.

For longer products, generate content section by section rather than in one large model call.

## Landing page

1 Read approved product metadata and content.

2 Generate page structure, sales copy, and FAQs.

3 Apply creator branding.

4 Render a responsive page from trusted templates.

5 Validate links, product data, and CTA behavior.

6 Allow creator preview and editing.

7 Publish only after creator approval.

Do not allow AI to generate arbitrary executable frontend code for published pages. Use structured page data rendered through trusted components.

# 8. Recommended Technical Stack

| Layer | Recommendation |
|---|---|
| Frontend | Next.js, React, TypeScript |
| Styling | Tailwind CSS |
| UI components | Accessible component library |
| Backend | Next.js server functions or modular TypeScript API |
| Database | PostgreSQL via Supabase |
| Authentication | Supabase Auth |
| File storage | Supabase Storage or S3-compatible storage |
| AI | OpenAI API |
| Workflow orchestration | LangGraph or durable workflow engine |
| Background jobs | Inngest or Trigger.dev |
| Document generation | HTML/CSS to PDF |
| Payments | Stripe or supported regional payment provider |
| Email | Transactional email provider |
| Analytics | Product analytics plus internal sales reporting |

### Architecture principles

- Separate AI orchestration from commerce logic.
- Use background jobs for long-running AI generation.
- Keep workflow state in PostgreSQL.
- Use typed schemas for AI inputs and outputs.
- Store generated files in object storage.
- Keep API keys and payment secrets server-side.
- Use idempotency for payments, publishing, and delivery.
- Avoid unnecessary microservices in the MVP.

# 9. Database Design

Use PostgreSQL with UUID primary keys, timestamps, and appropriate indexes.

| Table | Suggested fields |
|---|---|
| users | id, email, created_at |
| creator_profiles | id, user_id, creator_name, niche, bio, audience_description, brand_preferences, created_at, updated_at |

| Table | Suggested fields |
|---|---|
| connected_profiles | id, user_id, platform, profile_url, external_profile_id, connection_status, metadata, created_at |
| creator_analyses | id, user_id, profile_id, analysis_json, source_metadata, created_at |
| product_ideas | id, user_id, title, format, target_audience, problem_solved, value_proposition, demand_evidence, suggested_price, confidence, status, created_at |
| products | id, user_id, product_idea_id, title, description, format, status, price, currency, content_json, branding_json, created_at, updated_at |
| product_versions | id, product_id, version_number, content_json, file_url, created_at |
| product_assets | id, product_id, asset_type, storage_path, metadata, created_at |
| storefronts | id, user_id, name, slug, theme_json, status, created_at |
| landing_pages | id, product_id, storefront_id, page_json, published_url, status, created_at, updated_at |
| orders | id, user_id, product_id, customer_email, amount, currency, payment_provider, payment_reference, status, created_at |
| workflow_runs | id, user_id, product_id, workflow_type, current_step, status, state_json, error_message, created_at, updated_at |
| workflow_tasks | id, workflow_run_id, task_name, status, input_json, output_json, retry_count, started_at, completed_at |

Add Row Level Security policies to ensure users can only access their own private records.

# 10. Payments and Digital Delivery

## Payment requirements

- Use a supported payment provider and store provider customer and transaction identifiers.
- Verify payment webhook signatures.
- Use idempotency keys.
- Never trust client-side payment success alone.
- Handle failed, pending, refunded, and disputed payments.
- Maintain an auditable order state.

## Digital delivery workflow

1. Customer completes checkout.
2. Payment provider confirms payment through a verified webhook.
3. Backend creates or updates the order.
4. Backend generates a secure download link.
5. Customer receives receipt and delivery email.
6. Customer accesses the product through a secure download page.
7. Download access is logged and can be revoked when necessary.

Never expose permanent private storage URLs. Use expiring signed URLs or authenticated download endpoints.

# 11. Security, Privacy, and Reliability

- Secure authentication and session handling
- Database Row Level Security
- Server-side secrets management
- Input validation and rate limiting
- File upload validation and malware scanning where appropriate
- Payment webhook verification
- Audit logs for important actions
- Retry and failure handling for AI workflows
- Backup and recovery strategy
- Privacy policy and terms of service
- Creator consent before accessing connected social content

Treat retrieved social content and uploaded files as untrusted input. They must never override system instructions or authorize actions. Creators must review and approve products before publishing. Check AI-generated products for factual errors, copyright issues, and unsupported claims.

# 12. Development Roadmap

| Phase | Work | Deliverable |
|---|---|---|
| 1. Foundation | Repository and environment; auth; schema; onboarding; responsive shell; storage. | Creator can register, onboard, and manage profile. |
| 2. Creator intelligence | Profile analysis; content upload; structured creator profiles; recommendations; evidence/confidence indicators. | Creator receives relevant product recommendations. |
| 3. Product generation | Outline; section writing; approval checkpoints; editing/autosave; quality review; PDF generation. | Creator generates and customizes a digital product. |
| 4. Storefront | Reusable landing page templates; AI copy; branding; preview; publishing. | Creator publishes a branded landing page. |
| 5. Commerce | Payments; checkout; verified webhooks; orders; secure delivery; transactional emails. | Customers purchase and receive products. |
| 6. Beta | Test with 20-50 creators; measure time-to-product, quality, conversion, first sale; fix failures. | Validated MVP ready for broader launch. |

# 13. Acceptance Criteria

- Creator can register and complete onboarding.
- System can analyze creator-provided content.
- Product ideas are relevant and explain their rationale.
- Creator can generate a complete digital product.

- Creator can edit and regenerate sections.
- Product can be exported as a valid downloadable file.
- Landing page is responsive and editable.
- Creator can configure pricing and publish.
- Customer can complete checkout.
- Payment confirmation is verified server-side.
- Customer receives secure product delivery.
- Creator can view basic sales data.
- Workflow progress survives refreshes and interruptions.
- Failed AI tasks can be retried without duplicating products or charges.
- Users cannot access other creators' private data.

# 14. Product Metrics

## Activation

- Onboarding completion rate
- Percentage connecting a profile
- Percentage generating their first product idea

## Product creation

- Percentage starting product generation
- Percentage completing a product
- Average time to completion
- Regeneration and editing frequency

## Publishing

- Percentage publishing a landing page
- Percentage configuring payments
- Time from signup to first published product

## Monetization

- Percentage of creators making their first sale
- Average revenue per creator
- Landing page conversion rate
- Refund rate

**Most important initial metric: Percentage of creators who successfully publish a product and make their first sale.**

# 15. Future Expansion

- Physical product discovery and AI-powered brand creation
- Supplier discovery and integration
- Print-on-demand and custom manufacturing
- Inventory and fulfillment automation
- Advanced email marketing and social media marketing agents
- Multi-channel commerce and native mobile applications

Design the underlying creator intelligence, product strategy, AI orchestration, storefront, and commerce infrastructure to support future capabilities without introducing them into the first release.

# Final Implementation Principle

Build a reliable creator business workflow first, then introduce more autonomy over time. AI should handle research, ideation, content generation, design assistance, and recommendations. The application backend should control authentication, workflow state, payments, publishing, file access, and order processing.

The result should feel like a single intelligent product to the creator, even though multiple agents, skills, and backend services work together behind the scenes.

# Digital Product Catalog

Cross-niche product formats for the AI Creator Business Platform

This catalog defines reusable product formats the platform can help creators build and sell. It is a practical product taxonomy—not a verified global sales ranking. Creators select a format, then personalize its topic, audience, expertise, examples, and visual style.

## Recommended product types

| # | Product type | What creators can make |
|---|---|---|
| 1 | **Ebooks** | Niche books, how-to books, recipe books, travel guides, and educational collections. |
| 2 | **PDF guides and playbooks** | Step-by-step instructions, business playbooks, tutorials, and practical reference guides. |
| 3 | **Workbooks** | Guided exercises, self-assessments, planning activities, and learning worksheets. |
| 4 | **Checklists and cheat sheets** | Quick-reference lists, launch checklists, packing lists, and concise action guides. |
| 5 | **Planners and journals** | Daily planners, goal journals, fitness logs, gratitude journals, and habit trackers. |
| 6 | **Online courses** | Structured lessons with modules, learning objectives, and downloadable resources. |
| 7 | **Mini-courses** | Short, outcome-focused learning experiences covering one skill or problem. |
| 8 | **Workshops and webinars** | Live or recorded sessions with slides, exercises, and participant materials. |
| 9 | **Notion templates and workspaces** | Content systems, project dashboards, knowledge bases, and personal productivity setups. |
| 10 | **Spreadsheet templates** | Budget trackers, calculators, business models, workout logs, and planning sheets. |
| 11 | **Canva and presentation templates** | Social graphics, slide decks, media kits, workbooks, and branded layouts. |
| 12 | **Business and document templates** | Proposals, invoices, client onboarding, and operating documents. |
| 13 | **Resume and career kits** | CV layouts, cover-letter templates, portfolio structures, and interview preparation packs. |
| 14 | **Social media content packs** | Hooks, captions, scripts, content calendars, post ideas, and campaign plans. |
| 15 | **AI prompt packs** | Curated prompts for research, writing, marketing, ideation, and niche workflows. |
| 16 | **Swipe files and resource collections** | Curated examples, inspiration libraries, directories, and reference collections. |
| 17 | **Recipe and meal-plan collections** | Recipe ebooks, weekly menus, meal-prep plans, and grocery lists. |
| 18 | **Workout and training programs** | Exercise plans, training calendars, progression guides, and tracking sheets. |
| 19 | **Video tutorials** | Software walkthroughs, demonstrations, editing lessons, and skill tutorials. |
| 20 | **Audio products** | Guided meditations, language lessons, audio lessons, soundscapes, and downloadable audio. |
| 21 | **Photography presets and LUTs** | Photo presets, cinematic color grades, and editing looks. |
| 22 | **Design and creative assets** | Icons, illustrations, fonts, textures, digital stickers, and reusable graphics. |
| 23 | **Stock media packs** | Licensed photos, video clips, backgrounds, and sound effects created or curated by the seller. |
| 24 | **Printable products** | Printable worksheets, coloring pages, activity sheets, wall art, calendars, and cards. |
| 25 | **Interactive tools and digital bundles** | Calculators, simple digital tools, and packaged combinations of related products. |

## How product formats adapt across creator niches

| Creator niche | Example products |
|---|---|
| Fitness | Workout program, meal-plan collection, progress tracker, training guide |
| Finance | Budget spreadsheet, savings planner, financial literacy guide, calculator |
| Travel | Destination guide, itinerary, packing checklist, travel budget |
| Photography | Preset pack, editing tutorial, posing guide, shot list |
| Food | Recipe ebook, meal plan, grocery list, cooking mini-course |
| Business | Business playbook, proposal template, planning dashboard, course |
| Beauty | Routine guide, tutorial, product comparison workbook, content pack |
| Education | Study guide, workbook, lesson pack, revision checklist |
| Gaming | Strategy guide, walkthrough, stream assets, resource pack |
| Parenting | Activity sheets, routines planner, family organizer, guide |

## Product builder design principles

• **Separate format, niche, and topic.** Product format is the deliverable (for example, workbook); niche is the creator's field (for example, fitness); topic is the specific outcome (for example, a 4-week beginner strength plan).

• **Use shared generation workflows.** Reuse the same creation pipeline for similar formats, then adapt the content and examples to the creator's niche.

• **Keep creators in control.** Let creators review, edit, regenerate sections, customize branding, and approve before publishing.

• **Prioritize simple, downloadable formats first.** Ebooks, guides, workbooks, checklists, planners, prompt packs, content packs, and templates are suitable early formats. More complex courses, interactive tools, and memberships can follow.

• **Support bundles.** Allow creators to combine several products into one offer, such as a guide + workbook + checklist.
